On Windows, I ran it though Ghostscript on huge documents with no difference. On Unix though, it dogged the

Ghostscript engine to death. (My awk script ran like a dream though.) A google board post led me to the most elegant auto-paging and auto-line-wrap function. The auto-paging is easy: when you're moving to the next line, if you'll go off the page, do the show page and new page routines first. The line wrap a bit more complex though. It splits by spaces, compares the length of the first word it got back against the right margin minus the current point, and decides if it needs to line wrap before printing this word. Then it displays the space. The elegant part? Argument 2 of the split function's return value is "the rest". Called in a loop, it cycles through all the words on a page, line-breaking as needed.Ok, most people don’t code in PostScript. Granted, like SQL, it’s one of those languages that’s usually coded by a program written in another language. But it’s so incredibly elegant!
